## How ANKER® Hooks Work

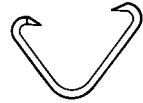

The ANKER® Hook design incorporates a staggered grip pattern that gives wire hooks exceptional holding power without degrading the integrity of the belt carcass. The points of the fastener pass through the belt carcass and are formed over, locking the carcass between them.

This low profile splice is highly compatible with conveyor components and compliant with the need for reduced operating noise. Additional splice strength and consistency of splice installation is obtained through precision machine application.

# General Hook Information

## HOW TO SELECT THE PROPER HOOK SIZE

- 1, Measure the belt thickness and pulley diameter.
- 2, Determine the possible options that could be used, based on the chart on page 8.
- 3, Select the proper hook from the specification chart.
- 4, If hook specifications overlap into more than one size, select the fastener which best meets your needs. **NOTE:** If maximum strength is of primary importance, choose the hook with the largest diameter wire. If low profile is needed select the hook with the smallest diameter wire.
- 5, Select the type of metal which best fits your application requirements.
- 6, Select a gauge pin to install the fasteners approximately 20% thinner than the belt thickness.
- 7, Select a hinge pin approximately 20% thinner than the gauge pin.

## SPECIAL LENGTH CARDS

Anker® hooks can be ordered in special length cards or welded bar strips for specific applications.

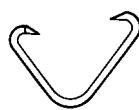

This eliminates time consuming card cutting by hand.

All special length cards are shipped without pins.

Please call Customer Service for price, delivery time, and minimum order quantities.

## How Anker® G Series™ Lacing Works

Anker® G Series™ Lacing is precision-stamped belt lacing from 316L stainless steel, ensuring a consistent 4,00 mm pitch over the entire length of the lace. The staggered leg geometry features four alternating point levels between the top and bottom of the lace which provides varying points of penetration versus a continuous

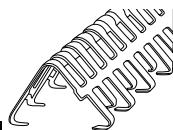

line, increasing the strength and durability of the splice.

G Series is machine-applied for consistent compression, resulting in a uniform and flat splice, even with belts that are prone to belt wave. Corrugated stainless steel hinge pins prevent migration during use.

## How Spirals and Spiral Lace Works

The **Anker® Spiral Lace Fastener** system was designed for small pulley, low-profile applications. The fastener is constructed of polyester

webbing, spirals, and hinge pins. It is installed by either insertion between the plies, ply stepping, or finger splicing.

## How ANKER® Patch Fasteners Work

ANKER® Patch Fasteners are manufactured from double-flattened wire which increases the holding ability as well as the transverse stability of the individual hooks, providing a flat and even splice area. The hook points are horizontally-cut, ensuring that they are bent accurately down towards the belt edge, which is especially important for thin belts used in laundry feeder and folding machine applications as well as in the filter belt industry.

Available in either galvanized or 316L stainless steel for Laundry applications, for the filter belt industry in 316L stainless steel, the hooks are integrated into the patch material. Especially for the laundry industry, the hooks are pre-cut to belt widths with leading and trailing ends. The patch is available for the Laundry applications with a custom logo if desired and with corrugated hinge pins included with each box of fasteners, corrosion-free and providing lubrication to the splice joint.

Applications	Installation Method	What You Need for Installation
• Commercial Laundries	ANKER® Patch-Fastener Hooks can be installed with the AHP 120-WNP on-site maintenance lacer or the ARK 150-WNP production lacer.	<ul style="list-style-type: none"> <li>• Patch Fastener Hooks</li> <li>• Hinge Pin KS Corrugated Perlon</li> <li>• Installation Tool</li> </ul>
• Filter Belt Industry	ANKER® Patch-Fastener Hooks can be installed with the AMK 400-NP production lacer.	<ul style="list-style-type: none"> <li>• Patch Fastener Hooks</li> <li>• Hinge Pin according to filtration environment</li> <li>• Installation Tool</li> </ul>
How to Specify the Correct ANKER® Fastener	Fastener Metal Selection	Hinge Pin Selection
1, Measure your Belt Thickness. 2, Measure the Diameter of the Smallest Pulley in your Drive with Belt Wrapping more than 90°. 3, Choose the fastener width that is appropriate for your specifications.	<b>Galvanized Steel.</b> For basic applications, galvanized steel is recommended.  <b>Stainless Steel.</b> Type 316 Stainless Steel offers more resistance than galvanized steel to abrasion, acids, chemicals, rusting, and magnetic attraction.	For both industries being served with ANKER® Patch Fasteners, different patch material and different properties are available: <ul style="list-style-type: none"> <li>• Polyester Patch</li> <li>• Polyester-Cotton Patch</li> <li>• Polypropylene Patch</li> </ul> Contact our Customer Service for more information.

## How Alligator® Lacing Works

Hammer applied Alligator® Lacing utilizes a design with teeth that are formed so that when they are driven parallel to the length of the belt, the vital longitudinal carcass fibers are not severed.

The compression fit of the connecting bar provides a strong, vise-like hold

on the belt and distributes belt tension evenly across the entire belt width. The one-piece fastener strip also ensures that there are no loose pieces to work themselves out of the belt and into the conveyed product. The flat splice obtained with a continuous strip of lacing also helps with hinge pin insertion.

## How Alligator® Ready Set™ Staple Fasteners Work

Designed for light and medium duty synthetic carcass belting, the Alligator® Staple fastener utilizes high tensile, stainless steel staple attachment, in conjunction with an extended plate design. This design separates the point of fastener penetration from the line of belt flexing to eliminate splice fatigue at the point of belt attachment.

Staple fasteners are furnished in strips with a bridge between each fastener plate. This strip design minimizes the chance of

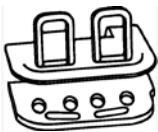

individual parts dislodging into the conveyed product. The one piece design provides a stronger splice, greater resistance to impact damage, and a smoother, unripped joint that simplifies hinge pin insertion.

Staples are hammer driven through the fastener and belt, working between the carcass fibers without severing them. The staples are then clinched cross-wise to the belt, so that belt tension does not pull against the staples to unclinch them.

## How Alligator® Rivet Fasteners Work

The Alligator® Rivet Fastener system uses the self-setting rivet technology that Flexco developed for the underground mining market. The patented rivets work between the carcass fibers, without severing them, leaving the entire belt carcass intact. The fasteners and rivets of this system are constructed from durable, abrasion-resistant stainless steel for long life. Because the rivets are self-setting,

fasteners are installed quickly from the top side of the belt. Rivets are driven through the fastener plates and the belt, passing between the carcass fibers. The specially-shaped head of each pilot nail works in conjunction with the application tool's anvil plate to set the rivets.

## How Alligator® Plastic Rivet Fasteners Work

The Alligator® Plastic Rivet Fasteners were developed to bring the many advantages of mechanical belt fasteners to those applications where metal belt fasteners could not be used. They are external, cover-mounted fasteners employing a one-piece, integrated design with rivets molded into the top plates of the fasteners. These rivets pass through pre-punched holes and are formed over through our Spin-Set™ technology, compressing the fastener plates and finishing the splice.

## FGP Food Grade Precleaner General Information

The FGP Food Grade Precleaner from Flexco is easy to install, easy to maintain, and disassembles in a snap for regular cleaning and sanitization. The FGP Precleaner works on any belt from 100 mm to 1500 mm and the blade is available in both white and blue FDA approved food grade material.

### Features and Benefits

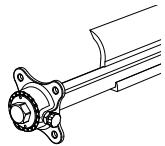

- Made of FDA approved materials for use in food applications.
- Certified by USDA for use in meat, poultry and dairy operations.
- Compliant with EU 1934/2004 food contact requirements.
- Simple design limits crevices and opportunities for bacteria growth.
- Snap on/off blade for ease of cleaning and blade replacement.
- Minimal hardware so installation, tensioning, and blade replacement are easy.
- Easily tensioned to minimize blade wear, eliminate belt damage, and maximize cleanability.
- Available in standard blade widths from 300 mm to 1500 mm. Can be cut to size.
- C-dimension gauge ensures proper pole location for optimal cleaning.
- Compatible with endless as well as mechanical splices.

### Specifications:

<b>Temperature Range</b> UHMW: -29°C to 60°C Dual Durometer: 0°C to 60°C	<b>Blade Height</b> 76 mm	<b>Blade Hardness</b> UHMW: 63D Shore Hardness Urethane: 85A Shore Hardness	<b>Blade Material</b> Food-grade UHMW, UHMW with Stainless Steel, or Urethane with PVC
<b>Pulley Diameter Range</b> 50 mm to 267 mm	<b>Blade Width Range</b> 102-1524 mm	<b>Pole/Mounting Material</b> 304 Stainless Steel	
<b>Blade Height</b> 76 mm			

### How to choose the correct size blade for your conveyor:

- 1, Measure your belt width.
- 2, Choose the Blade Width that corresponds to your belt width.
- 3, Measure your conveyor width.
- 4, Verify the Maximum Conveyor Width shown in the selection chart is larger than your conveyor width. If your conveyor width is larger than the maximum width shown, choose the next larger blade width that accommodates your conveyor width.
- 5, Blade and/or pole can be cut to users required length. Pole must be 50 mm longer than the outside width of conveyor structure at the mounting location.

## Light-Duty Transfer Solutions General Information

When it comes to belt-to-belt transfer of product, Flexco understands the importance of a trouble-free transition.

The Hitch Guard from Flexco is engineered to provide a smooth transition of product over the conveyor hitch. The Hitch Guard prevents small objects from becoming lodged between the belts at the hitch which can cause longitudinal conveyor belt tears, damage to conveyed products, and costly periods of unscheduled downtime.

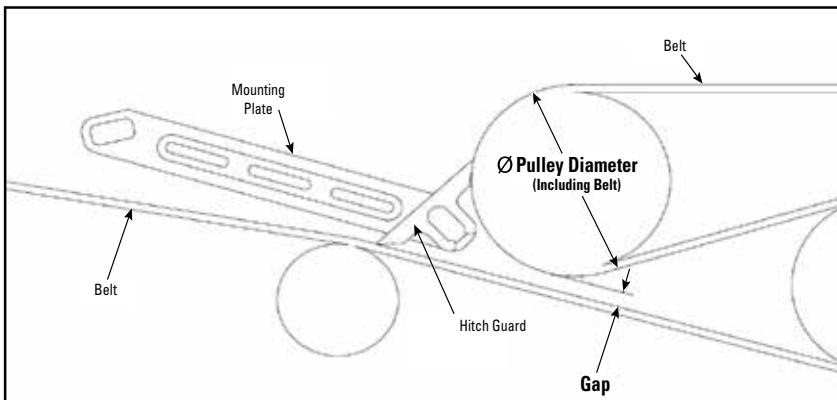

Segmented Transfer Plates offer similar protection at transition points. Designed to

accommodate belts up to 1500 mm wide, different segment lengths can be paired together to provide options for offset mounting and accommodate gaps from 100 mm to 250 mm.

Both Hitch Guards and Segmented Transfer Plates are designed for individual segments to release from the support bar, so that objects are quickly dislodged while remaining segments stay secured for continued operation.

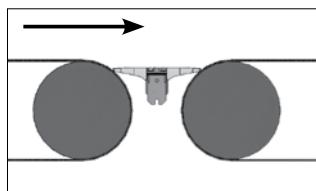

### Hitch Guard Ordering Specifications:

Pulley Diameter (mm) (including belt)	63,5	76,2	88,9	101,6	114,3	127	139,7	152,4	165,1
Minimum Gap Required (mm)	20,3	12,7	2,5	0	0	0	0	0	0
Maximum Gap (mm) (mounting plate installed above belt)	40,6	35,5	30,4	25,4	20,3	15,2	10,1	5,0	0

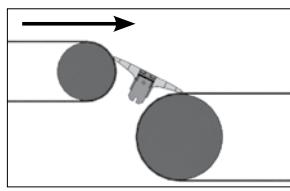

### Segmented Transfer Plate Ordering Specifications:

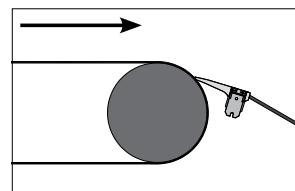

1. Specify belt width, Mounting bar is 50 mm longer than specified belt width.
2. Determine transfer size required.
3. Determine mounting bar location and if offset is required.

**For horizontal to horizontal belt applications.**  
Measure distance between pulleys at a point 12 to 38 mm below the tops of the pulleys (including belt thickness).

**For waterfall applications.**  
Measure distance from about 45° from the top of the upper pulley to the top point on the lower pulley.

**For belt to chute or slide applications.**  
On pulley side, position no higher than 12 mm below the crown with bridge segment positioned roughly 3,1 to 12,7 above the top of the chute or slide back wall.

## Tatch-A-Cleat® General Cleat Information

### Cleat patterns

When choosing cleat installation patterns, you should give major consideration to the type of return support which is available or feasible.

Where conveyor pulley center distances are 15 feet or less, it is often possible to omit return rolls safely.

Where the curved or chevron pattern is used with standard return rolls, cleats should be arranged so that they provide

a set of continuous contacts between cleats and rolls. On drives using pulleys less than 150 mm in diameter, curved or chevron patterns should not be used.

The ends of cleats mounted in a curved pattern should be tapered to lead smoothly onto return rolls.

### Suggested minimum cleat height for various sized materials and degrees of incline

This chart assumes that material being conveyed has a 30° natural angle of repose. For rounded or free-flowing materials with a natural angle of repose of less than 30°, use the cleat corresponding to the next higher material size. (For example, if your material is 4" high, with a natural angle of repose of less than 30°, and your belt incline is 40°, you would use a 3" cleat — that is, the cleat size corresponding to 5" material.)

#### Cleat Height

	8"	6"	6"	6"	6"
7"	6"	6"	6"	6"	6"

	30°	40°	50°	60°	

#### Belt Incline

### Suggested cleat spacing

This chart assumes that material being conveyed has a 20° dynamic angle of repose (30° natural angle of repose) and that cleats are installed at a right angle to the belt edge. For more free-flowing material, use slightly closer cleat spacing.

#### Cleat Spacing

Type	Cleat Pattern	Return Rolls	Recommended
IN TROUGH		SPLIT ROLLS	Where Cleats are needed only to lock material in place on the conveyor.
STAGGERED		SQUIRREL CAGE	Where drain-off of liquids presented special problems.
ACROSS BELT WIDTH		SELF-CLEANING	Where incline is steep and/or material has high flowability — as with large, round, or uniformly sized material.
CURVED		STANDARD RETURN ROLLS	Where increased load capacity is required with a given belt width, trough, and incline.
SPLIT		RUBBER-DISC	Where drain-off is a problem, and rubber disc-type rolls are available.
CHEVRON		STANDARD RETURN ROLLS	Where drain-off is a problem, and standard solid return rolls are used.

## How Flexco® XP™ Staple Fasteners Work

Flexco® XP™ Staple Fasteners offer a smooth, low-profile that makes them compatible with belt cleaners and other conveyor components.

The Flexco XP Staple Fastening System is designed to set one fastener at a time so misdrives and tool jams are infrequent, regardless of whether you are installing manually or hydraulically.

An integrated guide plate makes loading heavy belts easier and the easily transported frame and applicator are built for durability and ease of use. One smooth motion of the handle or lever compresses the plate, then drives and folds the staples for the same consistent staple set and finished splice profile each and every time. The larger loop area in the staple accepts a bigger hinge pin for extended splice life.

## How Flexco® Bolt Hinged Fasteners Work

Flexco® Bolt Hinged fasteners provide a flexible joint for belts operating over small pulleys. Because the joint is easily separated by simply removing the hinge pin, entire belt sections may be added or eliminated.

Designed as a compression fastener, the Flexco® Bolt Hinged model is fastened to the belt ends with high strength bolts. The

bolts compress the plates into the belt cover. Additional holding capability is provided by the fastener teeth that imbed in the belt without damage to the belt carcass.

This combination distributes the splice tension across the entire plate width while the teeth secure the fastener into the belt carcass to resist pull-out.

## How Flexco® Rivet Hinged Fasteners Work

Designed for synthetic carcass belting as well as other styles of belt, Flexco® SR™ (Self-Setting Rivet) Fasteners utilize multiple rivet attachment. This provides maximum resistance to pull-out and allows the patented rivets to work between the carcass fibers without severing them, leaving the entire belt carcass intact. It does not rely solely upon the carcass material to resist pull-out.

Because the rivets are self-setting, fasteners are installed quickly from the top side of the

belt. Rivets are driven through the fastener plates and through the belt, passing between the carcass fibers. The specially-shaped head of each pilot nail works in conjunction with the applicator tool's anvil plate to set the rivets.

The same hammer blows that set the rivets also compress the fastener plates into the belt cover. The broad width and heavy gauge of the plates give extended wear life. These plates compress uniformly and are specially coined so there are no high spots or edges to hang up.

## How Flexco® Bolt Solid Plate Fasteners Work

Strength of this fastener is derived from the compression of the plates, mounted above and below the belt, with high tensile strength bolts. This "compression" distributes the splice tension across the full width of each fastener plate. The holding ability is, thereby, increased by not solely relying upon the bolts to resist pull-out.

Additional strength and resistance to pull-out is obtained from the specially formed teeth on each plate. These teeth imbed deep into the belt carcass, without damaging the carcass fibers.

A tight butt splice is achieved through the exaggerated bolt hole spacing in the templet which forces the belt end together, Flexco® Bolt Solid Plate Fasteners permit natural conformance with troughing or transition idlers.

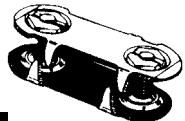

140, 190 and 2-1/2 size fasteners are specifically designed for thinner belting, allowing increased compression, greater reach-back, and more fastener plates per belt width.

How to Specify the Correct Flexco® Bolt Solid Plate Fastener	Fastener Metal Selection	Hinge Pin Selection
1. Determine Belt Tension (PIW). 2. Measure your Belt Thickness. 3. Measure the Diameter of the Smallest Pulley in your Drive with Belt Wrap more than 90°. 4. Choose the fastener size that is appropriate for your specifications in the selection chart below.	<b>Steel</b> , For most applications, steel is recommended. <b>MegAlloy®</b> , For superior resistance to wear and abrasion. <b>Stainless Steel</b> , Type 316 Stainless Steel provides extra resistance to abrasion, magnetic attraction and corrosion from acids and chemicals. <b>Everdur®</b> , Spark-free material compared to steel and fully non-magnetic. <b>Flexco®VP™</b> , Rubber covered steel top plates. <b>Promal</b> , For superior abrasion resistance, Some minor chemical and corrosion resistance.	No Hinge Pin Required.

## How Flexco® Rivet Solid Plate Fasteners Work

The Flexco® BR™ fastener offers longer service life in demanding, higher-tension applications and is an excellent replacement for vulcanized splicing in a wide range of industries.

Designed for high strength synthetic carcass belting, the fastener is installed with a staggered pattern of rivets to ensure maximum grip on the belt fibers. Working between these fibers without severing them, the strength of the belt is left intact.

The specially-shaped head of each pilot nail works with the installation tool's anvil plate to "self-set" the rivets.

The same hammer blows that drive and set the rivets also tightly compress the fastener plates for the strongest possible splice. The broad width and heavy gauge of the plates give extended wear life. These plates compress uniformly and are specially coined so there are no high spots or edges to hang up.

Applications	Installation Method	What You Need for Installation

All that is needed is a hammer and the portable MBRT tool. Belt ends and fastener strip are held in proper alignment. Upon proper alignment, the rivets can be hammer-driven and set from the top side of belt.	<ul style="list-style-type: none"> <li>• Fasteners</li> <li>• Rivets</li> <li>• Flexco Installation Tool</li> <li>• Hammer</li> </ul>
